

Claims

- [1] 1. A control device for regulating the pressure medium flow in a door closer utilising a pressure medium, including a guiding part (32) of the control device that can be supported on the door closer body using a thread fillet (33), and a control part (51) with a bevelling (52), which allows the control device to be moved in its axial direction by turning the control device supported on the door closer body in relation to the body in order to result in the desired restriction of the pressure medium flow by the control part (51) and its bevelling (52), characterised in that the control device (510) comprises, at the bevelled end (52) of the control part, a support part (53) and a collar (54) that is a resilient material and can be placed around the support part (53) for providing a supporting surface that can be placed against the door closer body, which control part and collar are used for supporting the control device on the door closer body and holding the control device in place in the pressure medium flow, which support is based on compression of the collar.
- [2] 2. A device according to claim 1, characterised in that the collar (54) comprises at least one chase (61) to reduce its thickness at a certain part of the collar.
- [3] 3. A device according to claim 1 or 2, characterised in that the collar (54) can be preinstalled in the door closer body so that when the control device is installed in the door closer, the support part (53) of the control device becomes seated in the collar.
- [4] 4. A device according to claim 1 - 3, characterised in that the collar (54) is plastic.
